

Condenser Cleaning Special

When was the last time you cleaned your Sub-Zero condenser coil?

Did you know Sub-Zero recommends vacuuming your condenser every 3-6 months?

Cleaning the condenser is important for the overall operations of the unit, including cooling functions. A dirty condenser may lead to warm temperatures. It may also cause the unit to run excessively wasting electricity. Condensation, frost, and water inside of the compartments may develop due to a dirty condenser.. If the condenser is not cleaned properly it may even cause premature failure of mechanical components in the unit resulting in costly repairs.

By having one of D&T Appliance Service's factory trained technicians perform the service; we not only clean the condenser coil, but give your unit a full inspection to help identify additional service requirements that may be needed.
